

Digital transformation at State Records NSW

Cassie Findlay

Project Manager, Digital Archives

Wrapped in plastic.. a digital archives project update

December 2, 2011

State Records' digital archives project has been underway for 6 months now, so before we all collapse for the Christmas break, thought it might be a good time to let you know how we're travelling.

Digitisation suite,
whimsically framed by
plastic sheeting

1. We're developing systems to support digital continuity partnerships

We see the protection, preservation and accessibility of digital records of the NSW government as a partnership with all of you; the agencies who create and keep records to support their business. Continuity of reliable digital information is as much about making sure you have business records for short and medium term purposes as it is about ensuring our collective digital memory is available via the State archives. Plus, records makers and users in the business simply know their information far better than we ever could. So we're working on tools that we can both make use of to manage, migrate and preserve digital records whatever their status. Some of the key elements of this approach, which we introduced

Policy on digital records preservation

[Purpose](#) | [Scope](#) | [Background](#) | [Definitions](#) | [Policy](#) | [Responsibilities](#) | [References](#)

Purpose

The purpose of this policy is to establish a set of principles underpinning the New South Wales Government's approach to the preservation of digital records.

Digital State records must be properly preserved so that they survive in authentic and accessible forms over the whole of their existence - from a few years, or the lifetime of an individual or asset - or forever, in the case of digital State archives.

If digital records are not preserved, there is a risk that Government will lose essential evidence of its business, that citizens will not be able to access records documenting rights and legal obligations and that there will be a significant gap in the body of records documenting the society and communities of NSW in the State's archives.

Scope

This policy applies to all digital records preservation activities conducted either by State Records or by New South Wales public offices, including:

- preserving records that are identified as digital State archives, and
- preserving digital State records that are required for long term retention but are not State archives.

Digital State records and archives may include:

What's On?

15 March: Retention and Disposal of Public Health Sector Records in Wollongong
Wollongong,

So we moved on to some
guiding principles

It's all about recordkeeping

- It's migration of a recordkeeping system
- Like any migration you plan it, map metadata, carry out quality checks
- You also need to document what you do and the reasons for the decisions you make along the way

- Recordkeeping system metadata
- Safe & secure migration metadata
- Preservation metadata
- Management metadata
- Wherever possible conforming to standards

Let's not make too much work for ourselves

- We will keep as many (or as few) versions of each migrated record as is necessary to ensure accessibility and integrity.
- No automatic normalisation process – decisions made about any new renditions as part of preservation planning
- Ongoing monitoring of formats part of the Digital Archives system

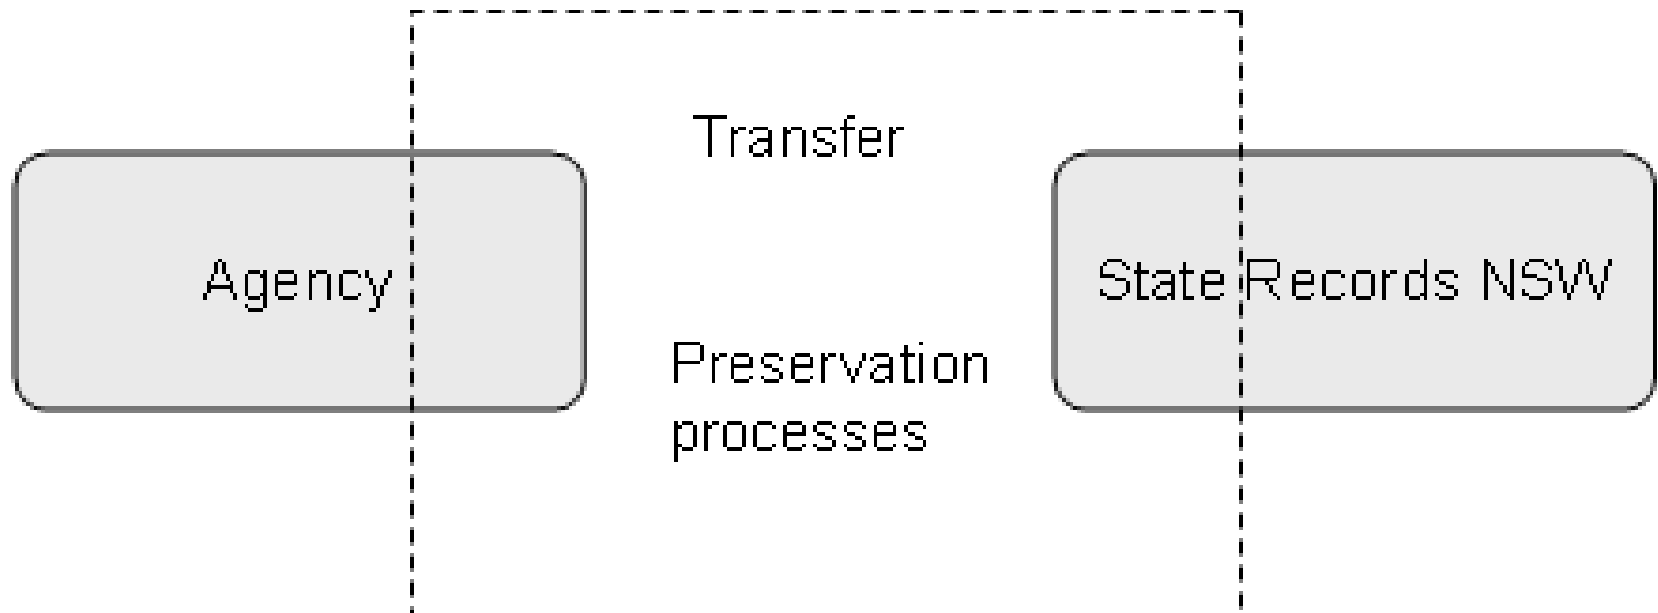

Systems migrations to archives

- Issues with ‘transfer’:
 - file level focus
 - linear process
 - assumptions about custody
- System migration as just one element of a project that we undertake with the agency

System migration project

Migration projects

- Each one will be different (people, recordkeeping systems, timeframes, risk factors), but will involve analysis of:
 - recordkeeping system structures, metadata
 - preservation issues
 - possible migration protocols
 - indexing points / potential uses
- Formal transfer stuff (disposal authorisation, access rules, t'fer of control)

Systems development

- Underlying ICT infrastructure
- Digital archives services
- Digital archives dashboard
- Publications NSW
- The API

Digital archives systems: modular ready to update

“You want to be makin
moves on the street,
have no attachments,
allow nothing to be in
your life that you
cannot walk out on in
30 seconds flat if you
spot the heat around
the corner”

- (Heat, 1995)

Trialling the new search tool... your feedback please

Feedback, Regular users

6 Responses »

State Records NSW is now inviting our regular users to trial <http://api.records.nsw.gov.au> as a new search tool for accessing the State Archives collection.

If you have tried this new search tool, and have feedback to give, we would love to hear it. We are actively developing the tool and would like to make it as useful and as intuitive as possible. So please post any feedback you have as comments to this blog post.

From time to time we'll post project updates to this blog. Any posts of particular interest for regular users using <http://api.records.nsw.gov.au> as a search tool are being marked with the "Regular users" category (in the right-hand column).

So far there have been posts on:

- [Searching the collection with the new API](#)
- [Citing series and items using Zotero](#) (Zotero is a free tool for managing research notes and citations)

So what's the whole API thing about anyway?

On this site, and in other places, you may find that the new search tool is also being described as an *API*, or *application programming interface*. This is because <http://api.records.nsw.gov.au> isn't just a search tool, it is also an interface for making the raw data underlying the catalogue accessible, particularly for re-use by developers.

It's a bit like toy trucks. If most online catalogues are toy trucks that you can play with, but only using the features built-in by the manufacturer, then <http://api.records.nsw.gov.au> is a toy truck built from lego bricks.

Because it is an API, you can take the search tool apart and use its "bricks" (i.e. XML or JSON versions of the search results and entities) to create other things (such as [this mashup of ministries entities](#)), mix it with other sources of data (e.g. to create federated search portals), or even upload your own data (by creating
